**Problem 1.** (proof Wilson's primality criterion)

Wilson's primality criterion: An integer n > 1 is prime  $\Leftrightarrow (n-1)! \equiv -1 \pmod{n}$ .

- a) Prove Wilson's primality criterion.
- b) Check if 29 is a prime number by using the criterion above.
- c) Is this criterion useful in practical applications?

**Problem 2.** (Pollard's p-1 factoring algorithm) Pollard's p-1 algorithm is an integer factoring algorithm.

- a) Please find the non-trivial factors of 1403 using Pollard's p-1 algorithm with a=2.
- b) Please find the non-trivial factors of 1081 using Pollard's p-1 algorithm with a=2.
- c) What can you tell from a) and b) and explain why.

## **Problem 3.** (Proof Chinese Remainder Theorem)

Prove the Chinese Remainder Theorem: Suppose  $m_1, \ldots, m_r$  are pairwise relatively prime,  $a_1, \ldots, a_r \in \mathbb{N}$ .

The system of r congruences

$$x \equiv a_i \pmod{m_i}, \qquad i = 1, \dots, r,$$

has a unique solution modulo  $M = \prod_{i=1}^{r} m_i$  given by

$$x \equiv \sum_{i=1}^{r} a_i M_i y_i \pmod{M},$$

where  $M_i = M/m_i$ ,  $y_i = M_i^{-1} \, (\text{mod } m_i)$ , i = 1, ..., r.
